

How to get size of individual shadow copy shadows?

Hi,

At <http://dev.thatsit.net.au/samples/wsh/shadow/shvb06.htm> there is a script that lists all the shadows on a computer, which works well on my Vista system. Shadows are the entities in which shadow copies and Vista backups are stored.

I can use the vssadmin.exe command line routine with the 'list shadows' parameter to list the time/date of each of the shadows (it says I have no shadows on my WXP system, which is probably true). With the 'list shadowstorage' parameter, I can also get the used, allocated, and maximum allowed total storage space for all shadows. I have not found a scripting way to get the size of each individual shadow.

I'm hoping someone will share a scripting way to display the size of each of the shadows.

Thanks,
-Paul Randall
