Thanks for reading this.

This code segment is part of a larger script that moves PST files so that they are accessible to users anywhere in the network. The rest of the script works but this is making me nuts. This is supposed to determine if two or more files have the same name, and if so, rename them to include the file dat or timestamp as well. It doesn't work. Can some offer some guidance?

DI

How can you have two files of the same name in the same folder?
