In addition to keeping patched, a firewall would prevent either worm.

>> *My computer was recently seemingly infected with some kind of blaster variant this evening. Out of nowhere when I was online, my computer gave the one-minute warning and then restarted. The only thing different than typical blaster warnings that I have dealt with is that the dialouge box said Isass.exe was producing the error. I have not been able to find anything after researching it online from my other computer, and the blaster removal tool is not detecting anything, as well as Norton (although it has not been updated in a long time). The only time it takes effect seems to be whenever I get online, which results in the computer displaying the warning message after about one minute or so online. Any help with this issue would be greatly appreciated.*
