I've to build a script to create a report which list all user's access rights to each network share on each File server on the network. I wonder if anyone has already done something similar.

Otherwise I thought to procede this way.

- On each file server run a script which lists all the shares on it
- for each share gets the ntfs security settings (groups)
- for each group gets the users and write them down in a file

can anyone point me to examples of these steps ?

thanks

Stefano
