Hi,

I would like to download some files from a central source server onto all the desktop clients on our network. I want to deploy these files via group policy logon scripts. However due to the size of the files (approx 30 Mb) after the first copy I only want the files to be copied if they have been changed.

For example if I update config.xml on the central server that one file

would

be copied down to all the clients (the next time they log on) however the remaining files in the folder wouldn't be copied as they are unchanged.

I've been trying to find a way to do this via WSH or a batch file, does

any

one have a suggestion? Unfortunately my knowledge of WSH isn't great.

If anyone is interested it's for a corporate screensaver which cycles through various images, the idea is we change the images occasionally,

for

example at Christmas time etc and they will automatically download the changed images when the PC reboots.

Place a batch in each startup folder with the following command.

```
@xcopy \\servername\shared_screensaver_files\*.* c:\local_folder\ /d
```

Re: Only copy files if updated

For further details on using xcopy, type XCOPY/? at a command prompt.
