Hello-

I'm trying to create a vbscript based WSH script. I'm having trouble accessing an enum that is a part of one object (Persist.enumObjectType - "myEnum") when using a function call in to another object (ImportExportUtility).

The enum is actually off of Persist (enumObjectType), but I when running the code in VB6, I have to reference class, not just an object.

Anyone know what I need to do to get this to work? Thanks much! AL

```
<job>
<reference object="ImportExportUtility.clsDBInterface"/>
<reference object="Persist.CDBPersist"/>
<object id="mIEUtil" progid="ImportExportUtility.clsDBInterface"/>

<script language="VBScript">

m_IEUtil.Import enumObjectType.myEnum, sParam2, sParam3

Set mIEUtil = Nothing

</script>
</job>
```

Could you explain what the problem you are having is - you don't really give details of what is happening, error codes etc

AJ
