Try "iis.msi", or "services.msi"

there you can forward settings to your clients.

It is not a wsh thing preventing you from doing what you want.

And security settings, the good old.

What browser are you using ?

I recently was at the Linen & Things, a 400+ outlets chain in the US. They had a good old lookup system for prices and ordering. No Scanners. And the "good old" Internet Explorer was on another table, sucking dust, that is displaying some sweepstake info.

Re: retrieve active directory user property = idle session limit

hi

i need some vbs script that change all the users in my active directory session idle time from 50 minutes to 30 minutes. (i have some users that have 2 hours and 8 hours) so i don't want all my users just the ones that have 50 minutes

"asdf" wrote:

"session tab"

Your implication is, that wsh can easily read,write,calculate,monitor GUI type stuff.

This is not the purpose of script, and not get you an answer.

You need to stick to "automation" and involved i.e. available MS components for a start.

Scripters don't like answers, typed by all monkeys in the universe, hear me ?
