I found that the pound sign "#"  
as first character of a folder name  
will disable relative path resolution  
of hta includes in path.

-----  
It will not find any css or js  
and in extreme cases will delay or  
"zigzag" mouse movements and prevent  
system shutdown.  
AKA as hang.

The pound sign is an anchor pointer in  
html

e.g. <a href="#PictureText"/>

It is a "legal" windows file system  
character.

\*\*\*\*\*

Using the pound sign "#" as first  
character for a folder name  
on a 2003 server required a schkdsk of  
nearly a Terrabyte.

My Editor UltraEdit wrote nullnullnull  
to the settings ini file.

Ms, I have the feeling I bought into  
some toy store

\*\*\*\*\*

Let me help you out here. It is not a  
control character

pound sign a system spoiler

and is number 35 in Ascii. But NT =  
unicode, eh ?
