OK how about, is it possible to do it without mapping a drive or creating a DSN. Is there a way to it within the code?

Try:

```
sConn = "Provider=Microsoft.Jet.OLEDB.4.0;" _  
& "data source=\\<server>\<path>\Test_Inventory.mdb"
```

I know MS Access is not designed for this purpose but is it possible to connect to a Access database in a script on a remote server?

Map a drive (e.g. X:) to the server's directory containing the .mdb and use

```
sConn = "Provider=Microsoft.Jet.OLEDB.4.0;data  
source=X:\Test_Inventory.mdb"
```
