I have a WSH script found at

<http://davefanher.com/Articles/2007/3/34.aspx>

This is a WSH JScript file that backs up a Subversion repository. The script works fine but I need to specify each folder in my WSH file as follows:

```
<?xml version="1.0" encoding="utf-8" ?>
<package xmlns="http://www.sppub.com">

<job id="FullBackup">
<script language="JScript" src="svn_backup.js" />
<script language="JScript">
var bak = new SVNBackup("c:\\REPOSITORIES\\REPOSITORY_FOLDER");
bak.DoFullBackup();
</script>
</job>
</package>
```

As I have a lot of repository folders, I want to create a new job that loops through C:\RESPOSITORIES and runs the backup on each folder.

Can anyone help me with the script to loop through the folders and run the backup?

TIA!
