Hi Nicky,

I have been working with Wei-Dong for past couple of days. And this is currently what we are seeing:

For the testing I created a test user who is only part of the local users group on the local machine, gave him permissions in the default site and the subsite as contributors in SPS.

Now from a browser running as test user, I see the same results as I see from the browser running under Admin account. (When I press the retrieve button under both scenario's it return only 1 result back)

Do you see this same behavior? Or am I completely out of track here.

I believe if you need this investigated further, please feel free to open a issue with Product support. (<http://support.microsoft.com>)

Thanks,

Anant Dimri

Hi,

Even if the user has full permissions on the main site and problem still occurs.

Nicky
