I built a little app that can create a SQL statement based on the list.

You can choose your site and list and it will match all the columns to their names in Sharepoint.

The trouble I am having is getting to the server's configuration for where the Content Databases are... I would like to be able to get the sql server and database name for a specific list (or just a site).

Does anyone know how to do this? I would like to use the SOAP query but anything will do...

Thanks!

.
