– Full text search doesn't include Booleans or wild cards so Net won't find NetSuite but it would find Nets (i.e. another version of Net)

Where is a good place to find out more about Full-text searches?

It's an SQL Server function so the SQL Server BOL might be a good place to look. Either that or search Google ...

Will 'child sites' also be searched?

No. The functionality in STS was to search the entire set of sites. There were complaints so the functionality of WSS (and the WSS part of SPS 2003) is to search a single site only.

Ok i had to un-tick and re-tick "enable full text search" on the central admin page and now have results; however, i assumed that the seach would be a "contains" type search, *Like* y'know *Like* oh my god... <wobbles head back and forth; the large poka dotted bow stays firmly fixed to the tight-pony-tailed hair> (apoligies in advance for poor SQL and high school cheer leader referenes... on to the question)

```
SELECT <Field> from <Table> WHERE <Field> LIKE "*<SearchTextString>*"
```

but no avail.. for I seek "Net" and "NetSuite" is not returned. Yet, querying "NetSuite" returns a record. And Child-Sites are not searched....

Re: full-Text Search questions

I am trying to get a full-text search to work. the central admin. site shows that full-text search is enabled and i have a 'search' box in the top left of the share point site. Also in the SQL admin (on the server) Full-text search is enabeled and started. From what I have read, i have completed all tasks necessary for this functionality, but with no positive result.

When a search for a document was performed, nothing was returned. the search phrase is contained in the document and in the document title.

Do SQL Server indexes need to be created? Can this be done automatically?
What fields are to be used?

Where is a good place to find out more about Full-text searches?

Will 'child sites' also be searched?

SharePoint Portal Server 2003, SP1 / SQL Server 2000

Thank you for helping me trouble shoot this function.
