Well, you need to give me some more detail about the problem. For the time being, you can change the level of trust to "FULL" and see if it solves your problem.

Hi,

I'm sorry about the delay, I've been working on another projects for a while.

I migrated my application to vs 2005 so I can work more comfortable.

I also wrote a web service that communicates my application with the extranet server's database, so I can read/write info from there.

I want to talk about this web service that is causing my headaches:

When I try to access from my app to a method of this web service, it throws me an SecurityException error.

Its not a problem of sql authentication cause I entered the right username and passwords and when I invoke the method locally, it works.

I've been investigating and I found that its something related to the CAS, and the level of trust, but I really don't understand what I have to do :S.

I'm sorry I changed a little the topic of the post but I this is something I need to do before adding the Document Library web service you gave me to my project.

Re: Sharepoint Documents' Storage

I hope you can help me!

Thanks,

Brian
