Thank you. I've been instructed to stand the web-part up in its current state (it works fine for people with administrative privelages on the machine) as an interim solution.

I tried using the revertto self method of impersonation late yesterday and it wouldn't work either. The default identity that the site uses is Network Service and it was tossing Access Denied errors as well.

I was wrong in stating that the impersonation worked if I was logged in as an Administrator, the development virtual server I was given had the default identity for IIS set to the Administrator account, so of course it worked, I changed it, un-installed and re-installed a fresh copy of WSS to fix some errors in the previous installation inconsistencies, and realized I was wrong.

The problem is that this is for a DoD client and I can't make too many changes on the server without huge political overhead and they need this up and running COB today.

I just started this job on Monday :)
