Hi guys,

A bit new to accessing Sharepoint with C# and Sharepoint in general.

Could anyone tell me if there is a way to add all users of a particular Windows domain to a Sharepoint site using C#? So that all the users in that domain can access that site.

If so how.

Any help would be much appreciated,

Thanks,

Bob

What I found is there is a utility already available named 'SPUserUtil' available at URL:

<http://www.microsoft.com/sharepoint/downloads/components/detail.asp?a1=724>

'SPUserUtil' is a command line tool similar to 'SPSADM'. It has two keys 'analyze' and 'update', former is used to generate the .xml file with all the user account information. We can change this file with new information, save it and can pass to sharepoint by 'update' key. So at one time you can update all the user account regardless of site collections.

Here is the link which explains the tool in detail.
