what your web part is doing? If your web part is accessing an external source for example active directory then a regular user will not be able to run your web part. What you should do is run that code using elevated privileges. Run your webpart in debugging mode and see where its is breaking and then put that code in a function and run that function as elevated privilege.

I have installed a web part into the virtual server. Sharepoint Portal administrator can view the web part page fine. But regular portal users gets error message saying "An unexpected error has occurred." Regular portal users has contributor right to the site that I have the web part at.

Ya, it is a permission issue. I am not sure where I am missing the permission settings.

How can I trouble shoot web part "An unexpected error has occurred." ?  
Any detail information gets logged any where?

Thanks for your feedback.
