I have received the error again. It appears that each time the SP Server is reboot, the Tahoe error will occur if a client tries to Edit Profile from File Explorer. To clear the error – Administrator on the server does an Edit Profile from File Explorer and all is well until the next reboot. I'm being to wonder if this is an IE related problem because the Edit Profile works from the Portal Document Library everytime. Also when coping files to the SharePoint folders from Network Link on a Client (IE 6 SP1, WIN2K SP4), we are receiving a Copy Error – You do not have permission to copy, but after 45 seconds the copy will work. From the Server (IE 5.5, WIN2K SP3), no copy errors. Both these issues have been within the last 3 months which the WIN2K SP4 has been rolled out. Any insight would be appreciated.
