Yeah, you know, I read a lot about customizing Onet.xml when it comes to this subject – I'm still just not getting it. When I open any of the Onet.xml pages, I can't find these references to links such as "Home" "Topics" "News" or "Sites". I imagine these links are being formed by an .aspx page, or maybe a Javascript? Maybe even a .css file, although I don't know how that would work.

Essentially, the problem is that the SPS site has expanded over the months, and so instead of just creating a new Site Template, I have to find a manually way to modify the code or file that generates the SPS NavBar that contains "Home Topics News Sites" so I can customize it...

What do you think?
