After installing and configuring a new portal installation, I am unable to "create a site". The log file reports that the the site can not be created due to invalid domain account info. During setup, the FQDN was entered for the domain with an associated account. It appears that the FQDN was not allowed, therefore each subsequent attempt to create a site fails due to the same error.

Question: How do you set the condition back to default to create a site without the previous domain/account info being applied. Is there a config file that can be modified or deleted?

Any assistance would be much appreciated
