have you looked at this documentation from MS site?

<http://www.microsoft.com/technet/prodtechnol/windowsserver2003/technologies/sharepoint/movewsdbs.msp>

Just to test the user, you could try to create a new application pool, sets its identity to the same as the one for sharepoint. Create a new IIS website and try to navigate on a simple html page. If its not working than you'll know that its not related to a Sharepoint config.

Pascal.
