Thanks for the tip ... that was a really quick response!

Unfortunately, my problem is a bit different from yours as the crawls are happening (correct number of documents are shown as being indexed) successfully. I tried it anyway, but nothing changed.

On a separate note, I did manage to solve the WSS search problem. It seems that viewing the page and seeing the checkbox for full text search filled wasn't enough. I needed to click "OK". About a half second later that part of the problem was solved. <G>

Keith,  
I had the same issue. see my blog for how I resolved it (manual reset of the portal search indexes)

Maybe someone can help me out here ...

To start off with, we had a single-server SPS 2003 solution running on SQL Server 2005 Express. (MSDE was not an option because the machine is also a

Re: Non-Portal content not being returned in search results?

domain controller). In this "proof of concept" environment, everything worked flawlessly.

Now in the implementation phase, that same server still hosts the SPS 2003 installation, but a 2nd server running SQL 2005 Enterprise now hosts the database content.

There wasn't much documentation covering the migration to be found, and the process didn't go as smoothly as I would have liked, but ... the site is once again up and running.

My only remaining problem is this: Nothing I do can return search results from any non-portal content. If I search on a term from within the portal, even if I choose "All Sources" the only results I get are from the 150 or so documents indexed within the portal. If I search on any term in any of the newfound search boxes on the WSS subsites (full text search is now on, but wasn't an option in the previous configuration) I get nothing.

I realize that these are 2 separate search engines and therefore might be 2 separate problems, however I thought it was curious that neither worked and that they may somehow be related.

On the SPS side, in looking at the gatherer logs, there are no posted errors and it claims to have indexed almost 600 documents (which would be correct).

I switched to advanced index mode, reset the non-portal index and rebuilt it, but this changed nothing.

Anyone have any ideas?
