- 

I am developing a SharePoint application in C# on SPS 2003. I want the "theme" or colors to be tied to a user session. For example, if a user in Department A logs in, he would see a Blue theme and a logo/graphic unique to his department, but if a user from Department B logs in, he would see a Green theme and a logo/graphic unique to his department.

I am trying to implement all the functionality in Web Parts so I can use web part pages and let SPS manage the storage, but I may have to development my own ASPX pages.

I know how to identify the user and I'm going to store unique attributes in the database on him. One thing I was considering was having an attribute identifying which CSS file should be applied, but I don't see exactly how to apply it. Any help would be appreciated.

Ken
