We have recently merged with a company who is still running an NT domain (upgrade to our AD planned for Jan).

In the meantime we need them to start accessing documents within SPS 2003.

Now I have them all as contacts with the Exchange Alias and AD Description as DOMAIN\_NT\user

What I would like is when I add the user user@xxxxxxxxxx it would then population the User Name field with the Alias (All the local AD aliases are the user names), would this be possible?

The reason is there is no standard format for the remote users, and I do not want a few hundred people here guessing a few hundred names there. And putting out a spreadsheet with the details on it.

Many thanks in advance

.
