What is your default permission on the site in IIS? do you have both anonymous access and integrated windows authentication? I usually gets this behavior when installing a new portal but when all configuring is done it's always gone, i can't point my finger on what exact configuration does the trick but i could investigate a bit more when i get back to the office:)

My tip is still that you concentrate on authentication to your website rather then code.

If i'm totally out, please post your solution or mail it, a bit curious on this one.

Hi Danne,

Thanks for your reply.

Yes, I have once tried adding the URL to the "Local Intranet" and the "Trusted Site" zones but it did not work.

On the other hand, it is Sharepoint's default behavior to pop up that login box whenever user tries to access the sharepoint page to which he/she does not the permission. This is by design and can be overwritten programmatically by setting the "CatchAccessDeiniedException" property of the site object to false. But this does not seem to be a global switch (see my original post for detail).

Cheers,
Tracy

Re: How to display the "Access Denied" page directly without the annoying Sharepoint login box?

Hi.

This actually sounds like a network login box from the way you describes it.

Add the url to a safe or intranet zone and give it another try.

Dear all,

I have set up different access permissions for the form lists of our Sharepoint site. When user with lower access permission tries to access a form list requiring higher permission, Sharepoint will pop up that annoying login box by default asking for username/password. It takes user three attempts before that "Access Denied" page is displayed. Is there a way to make Sharepoint display the "Access Denied" page directly without popping up the login box at all? Any advice?

By the way, I tried to put a web part on the site home page and added the following code for its "CreateChildControls" function. But it does not work. Looks like this "CatchAccessDeniedException" property is not a global switch.

```
protected override void CreateChildControls()
{
    // Turn off the login dialog in case of authenticating error
    if
    (SPControl.GetContextWeb(Context).Site.CatchAccessDeniedException)
    SPControl.GetContextWeb(Context).Site.CatchAccessDeniedException
    =
    false;
}
```

Thanks,
Tracy
