Hi Steven,

I am currently looking at ways of setting up authentication for my sites. We want to use FBA, and I have tried LDAP and AD providers. At the moment, I am using the AD provider as our AD/LDAP doesn't allow anonymous binds and I can't find a way of passing credentials to the LDAP provider. If I took your LDAP provider, (<http://www.sharepointblogs.com/helloitsliam/archive/2006/08/15/10066.aspx> comments) I could adapt it and add my own credentials to the call, with your permission....

With the AD provider, there doesn't seem to be a way of linking profiles imported with the AD import to accounts created with the ADMembership provider. Is that what you found?

At the moment, we need to use FBA, and we need to have personalisation/MySites, and what you describe here is the only way I have found described that will support this.

Thanks

Mark

I've successfully create a custom LDAP membership provider for use on our main web application. LDAP was used as a custom source for importing profiles. By mapping uid from ldap to username in both the custom provider and the profile import, sharepoint can associate users to their profiles. In doing so our main site uses the displayname from the profile even thou the person authenticated from the custom provider.

From these ldap account I am able to create mysites. However because

mysites are hosted by a Share Services Provider it too needs to use your custom membership provider.

At the current time I use AD to authenticate users access to the LDAP MySites. Thing is, is you click MySite, you then have an AD MySite created.

thanks for your reply, but i dont know how to import profile into Sharepoint for a user created on machine only?

"madhur" wrote:

Hi

Did you check the user profiles. You might have to correctly import the user profiles.

Tirath wrote:

hi,
but in case of local computer accounts, "My Site" gets created, but the user display name remains "servername\account name". How do you change this for local computer accounts to display full name?

Thanks

Mr. Bill:
Thanks for your reply.
I could get My Sites for domain users and local computer accounts without any problems.

So, As I understand it: If the portal site users should have profiles, and My Sites, then we can

Re: MOSS My Sites for non-AD users

only use domain accounts.

Thanks,
Vamsi
