Hi

I have a site structure 4 levels deep, something like this:

```
Top
|
-- A
|
-- A 1
|
-- A 11
-- A 2
-- A 3
-- B
```

and I have a calendar on every site.

When I had an event to the calendar in A 11, calendars in sites A1, A and Top will be updated with a new event.

I can make this work easily with event handlers, the problem is when I want to have a recurring event to the calendar on A 11...all calendars above will be updated and a new event is added, but it is not displayed in the calendar view, only in All Events View.

Can someone explain me how can this be done?

There is another weird thing going on, when I delete a recurring event in site A 11's calendar, ItemAdded eventhandler is fired. Since I make the calendars update on ItemAdded eventhandler, all calendars are updated again and another event is added to those calendars...the weird thing is that it works...after this the recurring events will be shown on every calendar view... The title of those events will have the word "Deleted : " before the title of the original event.

Why is this thing happening?

I've googled around and I've noticed that there are several people with the same problems...recurring events once copied to another calendar will not show in calendar view.

Sharepoint Calendar – Recurring Events

Thanks in advance.

Jorge

PS – I've followed the process showed where ->
