Hi,

doing a workflow in sharepoint designer, the workflow send an email with values from the fields in the sharepoint list the workflow is attached to.

One of the list fields is a user/group field, so through sharepoint you get the address book and check name icons and you can search your active directory users and put a username in.

Then in sharepointdesigner when you access the field in an email using 'add look up to body' it appears in the email in the format:

domain\username

I want to get it so it had the actual persons name which is also stored in active directory.

I have SQL 2000 so I don't think I can access AD directly in sharepoint designer without having 2005.

Does anyone know a simple way to get the active directory fields that aren't in sharepoint designer into it, like first name, last name or display name so I can use them in an email template?

Thanks

.
