Hi,

I assume you guys are using basic authentication. Is that true? I can't get integrated to work in this way.

I have a web service (a DIME receiver currently sitting outside WSS because I can't get it to work inside without breaking the WSS services). This service receives a DIME attachment and uploads it to a document library using WEBDAV. However without defining credentials in the web service I can't get it to work, ie. I get error 401. This is because my default credentials seem to always be blank. Creating credentials and then calling WEBDAV works fine, but then I lose the context of the user loading the document, and therefore the rights they have to the libraries etc.

I think this is because with integrated the credentials are not sent with every request once the user is authenticated the first time. Seeing as how I'm pretty much authenticated to the server when I login, I never get any default credentials on in the first hop to pass on!

Anyone have any ideas? One thought I had was to put the web service inside WSS and not have to worry about the second hop at all, but when I add the webservice extension to the web.config it breaks all the WSS services! While I don't use these services anyway it seems like a bad idea to have them broken!

Thanks,

Aaron.
