Hi guys

I installed wss in server farm and after the installation when iam extending my site the configuataion is asking for DATABASE SERVER NAME and DATABASE NAME.

I was under the impression the wss should create two databases (one for config and one for content and it did when i install both front end and database server on the same server).So in server farm installation i gave my remote DATABASE SERVER NAME and DATABASE NAME (as it is a must be filled field). Everything went well and i am able to restore a site from other server using stsadm also. But i am not able to see two database. I am able to see only one database in the enterprise manager. Is it ok or did i make any mistake? If it is correct how wss knows where to look for config and where to look for content. I want to understand more. Please help me.

Thanks in advance.

Parth
