Well, when installing Sharepoint, the installer did display a message saying it found frontpage extensions on the default web and I could either cancel or continue and extend the default web later. I selected continue.

By the way; I also used the backup option in Frontpage2003 before the crash; so I have those backups too. Perhaps I should have just installed sharepoint and used the smigrate to restore the web sites. That may have rebuilt the SQL databases from scratch.
