As a followup, I've been trying to figure out how/where to add this to the Excluded Paths, but am confused about what to enter as the path. I can move the cmgshare folder so that it is more accessible but where? It's confusing how the SharePoint URL corresponds to a path on the server.

> <script language="JavaScript"
> src="/_layouts/cmgshared/includes/IntraHeader.asp?tabStyle=intranet&tabSelected=2"></script>
- >
- > When I create a new site based on this template and I do a view source, I see the javascript line, but it didn't run my IntraHeader.asp page. Is there something more I need to do to get it to run ASP from inside a SharePoint page? Maybe I need to put the "cmgshared" folder that contains the asp file and supporting files somewhere else?
