Ok... I went into IIS, Web Sites, Sharepoint Central Administration and right clicked and selected properties. It did say All Unassigned with a port. I clicked on Advanced and clicked Add. I kept it as All Unassigned, used the same port as the other one, and called it "intranet". I reset IIS. This did not work. I have a feeling I'm not really doing what I'm supposed to. :)

ok, well you are going to need to set the host headers then, it doesnt know how to resolve the default website. Go into IIS, right click on the virtual server, select advanced on the first page that comes up (it should be next to your IP assignment, which should be set to all unassigned unless you are binding an IP and have SP2), there you can enter the name you want your site to resolve too :)

I am able to access the site now since I changed teh Identity on the App Pool to my account. However, I am only able to access the site if I am physically on the web server (<http://localhost/intranet>). I cannot access it from my personal computer (<http://url/intranet>). It asks me to log in (network login pop up) and will not accept my login.

ok... the only thing in this article  
(<http://support.microsoft.com/kb/823287>)  
i think it could be is

The account that is used by application pool  
does not have the required  
permissions to the SQL Server database.

How do i set db access on teh app pool?

"SharinDenver" wrote:

Ok... I made Network  
Service a dbo on the db.  
Now I get this error:

Unable to connect to  
database. Check database  
connection information and  
make sure the database  
server is running. For tips  
on troubleshooting  
this  
error, search for article  
823287 in the Microsoft  
Knowledge Base at  
<http://support.microsoft.com>.

The database is running and  
it is on the same machine as  
WSS is  
installed.

I am in the process of trying  
to figure this one out, but if  
anyone can  
save  
me some time, I'm all ears.  
:)
