If you had WSS running without SP1

He wrote "I had a nicely functioning *SPS* site" (My stress).

Not *WSS* !

If you had WSS running without SP1 and now want to use the database with WSS SP1 it can't happen since the database structure is different. But you can try and go to the central administration page of Sharepoint and defying a different content database for your new site. Central Administration page > Configure virtual server settings > Manage content databases > Add database > "sts_server2_1" > Ok > Click on the database that was already there and at the bottom of the page check 'remove content database' > ok

That's it :)

Greetings, I have a bit of a mess and before starting anew I thought I'd give the experts a go. I had a nicely functioning SPS site until I tried to upgrade my SBS server to SP1. The upgrade failed, as did the backout. Apparently my backup did not include system state so I could not recover.

Since then I've rebuilt the SBS and installed SP1 as well as SQL Server.

Re: Recover SPS to SQL Server from Desktop Engine data

I
have the
following data files available:
----.STS_config.mdf
----.STS_config.log.ldf
----.sts_server2_1.mdf
----.sts_server2_1.log.ldf

I've created a new SharePoint site on SQL Server with a name of <http://companyweb/default.asp> which is different from the old one.

My question is .. can i import these files into the new site and get
back
to where I was?

FYI, I'm running SBS2003, SQL Server

Thanks, in advance for the help.

Mike
