You're absolutely correct. It just sounds like the user's IE might be caught in a some level of credential confusion. Assuming that Liz has rebooted the machine, which she says she has, and the user is still accessing the sharepoint server as someone they are not, then something is up with IE. All I'm saying is that if bad credentials have somehow been saved on the client, and at some point they are no longer valid, the account that is being used may be prone to being locked if attempted accesses fail too many times due to an incorrect password.

"No jeremy it will not backfire

When you reboot or kill all client sessions it will force the user client to login to Sharepoint as themselves.

Since authentication is done between IIS level (well asp.net) and the client workstation uses (NTLM or Kerberos), the credentials sent is of the login user on the client. The authenticated login user in either case is not the administrator. Therefore closing and reopening all browsers or rebooting will send the login in user information, not the Administrator hence no chance of lock out

For the client side, you could try two things. First, in IE, Tools, Internet Options, Advanced, Toggle Enable Windows Integrated Authentication. Might want to uncheck it, reboot, access the server and pass in users creds. Then recheck it (and reboot). That might clear out the saved password.

Might also try clearing out all saved passwords in Tools, Internet

Re: User log out?

Options, Content tab – Auto–complete. Hit the button and uncheck the passwords checkbox.

Last solution which might end up backfiring is change the admin password. The user will probably end up locking the admin account, but at least then you have the option to provide different credentials on his box, which would hopefully overwrite the admin creds.

Liz wrote:

Hi there,

SBS 2003 with SharePoint service

Background: Two weeks ago, one of my users was being prompted for his password to get onto SharePoint, even though he was logged onto the network.

I reset his network password on the server, sat down at the desktop, and again his password was rejected. (this is not the problem)

Problem: I'm an idiot. While logged on his user account, I gave SharePoint the admin name & password. It worked, of course. BUT, it never logged out of Admin, so now when the user makes a posting, he's doing it as the Admin!

How do I log him out of SharePoint as Admin, and back in as himself?

Thank you
