Thanks for replying;

Clean Install: Yes The server was new hardware with 2003 server enterprise edition and was a DC. I honestly don't remember if I was asked to promote to DC before IIS installed. I can only say that most of my sites were migrated from an older server that was in-place upgraded to 2003. But I know I have created WSS V.6 sites on this box from scratch.

I did spend quite a bit of time trying to get sts and wss to run together on the same box. (Dumb).

The single server has 12 virtual sites (5 on the Internet) using host headers. I have no problem creating sub webs in FP2003. This kind of started after having no problems for over a year. I can't find any trace of frontpage 2002 extensions, at least in ad remove programs or in windows setup.

Note that when I create the initial virtual site in IIS and go into WSS Admin, it shows up as a version 5 site. This is of course the problem. I wouldn't mind migrating the sts version 5 except we're talking about a newly created site; so there is nothing to migrate.

ASP v1 ??? I don't know how to tell what version of asp.net I'm using. I see that in my IIS Web Service Extensions List
active server pages allowed
asp.net v1.1.4322 allowed

Engelbert wrote:

Was this a clean installation of 2003 Server when you started the whole WSS installation process? (Thinking about bits of FPSE from previous installations)

Did you specify the DC before IIS (this order is essential) ?

Did you – when in the Applications Server wizard (or IIS) – when not

Re: WSS Can't Extend New Web Sites Created In IIS

specifying FPSE, specify ASP.NET support and was this v1) ?

Windows 2003 Server (DC) WSS 2.0

It's important to note here that (Frontpage Extensions 2002 ARE NOT INSTALLED)

I create a site in IIS, the local path is C:\Inetpub\SampleSite, then I right click the new site and launch Sharepoint Central Admin to extend the new site. Note, I notice the site at this point is NOT Running and won't start. Also, there are no files or folders in the \sampleSite directory.

In Central Admin I have my new site listed:

VERSION

Default Web Site <http://spserver/> 6.0.2.

6.0.2.6568

SampleSite <http://www.samplesite.com> 5.0.2.6738

Upgrade

Notice the Versions of the two sites thus far.

I click SampleSite to Upgrade and the process runs and ends with a help window telling me the following:

To upgrade your server to Microsoft Windows SharePoint Services, run Setupsts.exe to manually upgrade. I do that but it fails with a message that I need to remove FrontPage 2002 extensions. I have 8 WEBS working just fine. I managed to create a site by scrapping an existing site I didn't need any more.

CAN ANYONE PLEASE HELP DIRECT ME TO A CURE!

Thank you.
