I know that I can view list content in the datasheet view, but to clarify I just want to see the list settings with out going into the settings of each list and manually copying/pasting all that information. Especially for column types such as choice and lookup, I do not want to click on each column to copy down the choices or lookup specific information. I was wondering if there is a tool that will handle grabbing that information for me? So far, I found that exporting the information to Access 2007, and viewing it in Design View, will give me some of the column-type information, but will not drill down deeper to get the specific settings/choices (depending on the column-type), and Access couldn't interpret some of the column types correctly such as 'people and groups', 'lookup' or 'choice', they just become 'memo' or 'text'.

.
