I have a WSS3.0 site and connecting to an SQL 2000 database. I have web part connections working properly to ensure my users are looking at the right data.

I have a multi line view of the data and I have an insert link enabled. My question is can the web part connection data be made to populate the textboxes of the insert view.

To explain fully: I select a Project in one data view and then view the entries of hours and activities against that project. This works correctly with the Project field always correctly populated.

When I hit insert however the Project field is always blank (as are all the other fields of course) even though the multiline view always selects the correct Project based on the web part connection. Is there any way to get those fields to populate with the desired data or should I be using a different methodology?

TIA Appreciate any help anyone is prepared to offer.
