It sounds to me like maybe you're dealing with two different versions of Arial, and Windows is just not interpreting it correctly. I'm not sure if you \*can\* (Arial.ttf might be a protected file), but try transplanting the fonts from the development computer to the computers you're running on...or the other way around...probably best to take XP's version of Arial and install it on the development computer.

That might not be the problem at all, but it's worth a shot.
