Hi all,

I'm working on a post-build program for my techs to automate some post build setup for machines in our company, and i need to set a number of Outlook settings. the two in particular that i'm having trouble with are the address lists (there's 3 that are used, and need to be ordered) and delegates (two dist. lists with only reviewer priveledges). I'm rather new at VB.net, and wondering if anybody had any clues as to where this information is stored in the registry or in a file. i've used a registry monitor while changing settings, but it doesn't come up with anything useful.

Thanks in advance
