Is something like that possible? Is there any (third party) control that will do what I need?

You can always use a single index and calculate $\text{row} * \text{totalcolumns} + \text{column}$ to find the right one

You can also create your own array

```
dim mylabels(1 to 2, 1 to 4) as label
```

```
for r=1 to 2
```

```
for c=1 to 4
```

```
set mylabel(r,c)=label1((r-1)*4+c-1) ' may be off depending on how they are set up
```

```
next
```

```
next
```

the events will still give you the single index but it's easy enough to calculate the row & col

.
