Im not sure if this is te place to post this question or not, but it seems to be where most of the Crystal posts are.

When we look at the Server properties it says it is a Windows Server 2003 for Small Business Server. It is also runnig Sharepoint. We do not have SQL except the SQL that is part of sharepoint

I have tried installing Crystal Enterprise, but it gets part way though the install and says that there is an installation of SQL and then requests a username and password.

The Install Says SQL Servr is configured for Windows Only Authentication, Input an NT Username to create a Database.

I have tried all of our usernames including the Administrator. I have also tried sa as the user.

I have also tried installing another instance of SQL with a password of 'password'. This install was done from the Crystal SQL server that is bundled with enterprise.

It still does not find the new instance and request a username and password that we do not have.

I have contacted business objects technical support, but had no joy, they said that the version of Windows we are trying to install on is not supported.

Im hoping somebody else has had this problem, and found a solution.

Thanks for any help

Mat
