Here is the problem. I have a VB .Net application which is launching a report (.rpt) that was created using CR v10. The application will then export the the report. Only I am having trouble using merge modules to install the application. Every time I go to run the application I get an error stating the I either have an invalid key or that it can not find the keycodev2.dll. However, I do have a keycodev2.dll.

So does anyone know how to use the merge modules with an vb .Net application that can execute external (not part of the project) reports (.rpt).

.
