Hi,

There is a class on the mysql site for connection to a mysql with .net. Try that.

<http://dev.mysql.com/downloads/connector/net/1.0.html>

Hi all,

I am using VS.net 2003, and VB. I am new to VB programming. I am trying to connect to a database on a server on our network. There are two databases one is Interbase, and the other is MYSQL. Both are being accessed via odbc. I can open the connections in the server explorer connect to the databases and view the tables. I can even view and retrieve data in the server explorer.

But when I try and connect to the databases in my application, I get an error message "Unable to log into database", this is with Interbase, and with mysql i get this error message "There were errors configuring the data adapter."

Whether I try and drag the tables from the server explorer to the form, or drag a dataadapter and dataconnection, and try and manual configure them, I get these error.

Now here is the strange thing. If I set up the databases locally, the connections work perfectly in my app.

This leads me to believe that it is a security iss. But I do not know where to look, or what to look for. The connection strings, userid, passwords are exactly the same for both server and local machines. I am unaware of any other security issue that need changing when designing a app and connecting to a database.

THanks
Robert
