```
Public Sub setdbpswd()  
Dim dbPath As String  
Dim dbConn As String  
  
dbPath = App.Path & "\database\jheks" & "\pswdjheks.mde"  
dbConn = "provider=Microsoft.Jet.OLEDB.4.0;data source=" & dbPath &  
";Jet OLEDB:database password ="  
dbpswd.ConnectionString = dbConn  
dbpswd.CursorLocation = adUseClient  
dbpswd.CommandTimeout = 30  
dbpswd.Open  
End Sub
```

Above is my programming where in this programming, we indicate that where the database location using App Path. But, using this same programming or others, how can i indicate myself which one i'm gonna insert to the database. It's seems like to have an input first before we can establish the connection to the particular database chosen.

The case is like this, I will have the path like "\database1\jheks", "\database\jheks", \database2\jheks" and so on. The case and the problem is, i want my user to indicate which database folder they refer to insert, and then my application will connect to it. But I don't know how to done that. For your infomation, this folder "\database" will refer to which batch of file will gonna insert to the database.

I've information where to select the database is using listbox/combobox, or also can using Windows Common Dialog. But, how to hold the selection and where to put it? Any tutorial that can help me?

Thanks in advance.
