

SQL UNION Question (or not UNION?)

I've been struggling with a query for a couple of days, and I can't seem to find a solution... so I thought I'd see if any of you have an answer.

I am trying to write a search to pull information from a couple different tables. Both tables contain similar information like Last_Name, First_Name, and Middle_Name. Each table also contains additional information. The first table contains an address for example, and the second table contains an address and a phone number.

I need to write a SQL statement to get only the unique names from each table, but also some sort of reference as to which table it came from. UNION will work, but I can't tell which table it came from...

I need the return to give me the Name, plus a reference to the table that it came from..... any ideas??

My thoughts so far...

```
SELECT DISTINCT Last_Name as LName, First_Name as FName, Middle_Name as MName From Table1 UNION SELECT DISTINCT LastName as LName, FirstName as FName, MiddleName as MName From Table2
```

Works great except I can't tell which table it came from.... any help is appreciated....

.
