Hi,

Hmm... I'm not sure why you say this:

>>

While OO is great for lots of things, it is most decidedly UNusable for some applications and is most decidedly UNusable in some places in MOST complex applications, ESPECIALLY in simulators and state machine logic.

<<

I do state machines in .NET often. I find them no harder than VB6. I'm not sure about "emulators" though. I'd have to have a notion about what you might be emulating (VT100?).

However, you are right. GoTo and GoSub must be done by some other approach. Since I haven't used either of these since I started programming in VB (1992), I have a hard time missing them.

Dick
