The following links are provided *only* for Programming improvement

All software are (almost) free :

Download the best API-guide software for free

(Updateable-With example for each function and Parameters info):

<http://www.allapi.net/>

Productivity add-in for VB6. Add indentation, complete missing code, auto-correct, backup, and get more desktop space. Also visualize your code with flow charts. Paste in a procedure or a code snippet and Visustin makes a graph for you.

<http://www.aivosto.com/vbcatalog.html>

(Look for "VB Friend 2" and "Visustin 2.0")

MZ-Tools 3.0 is an "all-in-one" add-in that integrates within Visual Basic and provides many features. (This one is Really Cool!)

www.mztools.com

"Windows API library for Visual Basic"

Download the file, Open visual basic 6, from the Project menu choose "References" and from the browse button locate this file and add it to the reference list. Then go to "Object Browser" from the code view and find all APIs under "Win" library. The available APIs will function as if they are native visual basic function. There is no need to declare API functions in the old boring way you did in your vb codes.

http://www.freewebs.com/api_library_for_vb_z/

I am wondering if other guys here have some other useful links for Visual Basic 6.

All the best

TOMMY
