Hello –

Yes ... I'm using Windows 2000 Professional.

After some (extensive) research I found the following article in the MS KnowledgeBase:

<http://support.microsoft.com/default.aspx?scid=kb:EN-US:838010>

The problem is a new version for SP3 of the Microsoft Forms 2.0 Library (FM20.dll) in \system32 which handles security differently. The article suggests to write a wrapper/container around the richtx32.ocx to resolve the problem. Well ... I actually just replaced the FM20.dll with a version I got from a colleague with SP1 installed. That's probably not the best way to do it because all the new security measures won't work but for now I can at least use my code w/o any changes to it.

Thanks,  
Joe
