Hi,

I have a Vb component which internally uses an exe to create a batch file , and read a key value from a file.

I call the method of this component from my asp page. When I debug through the asp page into the component and back I get the value generated correctly but when I try this by access the page normally without debugging it, the component is not generating the key.

I am using component services to register the dll. I am at a loss why it works in debug mode and not other wise. Does the fact that I run an exe within my component have anything to do with it?

any help would be great.

Thanks,  
jbhan
